

A wide-angle photograph of the Gardens by the Bay in Singapore at sunset. The scene is dominated by the Supertrees, which are tall, tree-like structures with intricate metal frameworks and greenery. In the background, the two large, glass-enclosed conservatories, the Flower Dome and the Cloud Forest, are visible. The sky is a mix of orange, yellow, and grey, with the sun low on the horizon. The foreground is filled with lush green plants and trees, and a body of water is visible on the right side.

Nature of Cities: building happier, healthier and more resilient urban environments

Maybe it is not a healthy place. The 150 or so people who live in the village, which sits on the south bank of the Ivindo River, deep in the great Minkebe Forest in northern Gabon, are used to occasional bouts of diseases such as malaria, dengue, yellow fever and sleeping sickness. Mostly they shrug them off.

Executive summary

The Lancet Countdown tracks progress on health and climate change and provides an independent assessment of the health effects of climate change, the implementation of the Paris Agreement,¹ and the health implications of these actions. It follows on from the work of the 2015 Lancet Commission on Health and Climate Change,² which concluded that anthropogenic climate change threatens to undermine the past 50 years of gains in public health, and conversely, that a comprehensive response to climate change could be “the greatest global health opportunity of the 21st century”.

The Lancet Countdown is a collaboration between 24 academic institutions and intergovernmental organisations based in every continent and with representation from a wide range of disciplines. The collaboration includes climate scientists, ecologists, economists, engineers, experts in energy, food, and transport systems, geographers, mathematicians, social and political scientists, public health professionals, and doctors. It reports annual indicators across five sections: climate change impacts, exposures, and vulnerability; adaptation planning and resilience for health; mitigation actions and health co-benefits; economics and finance; and public and political engagement.

The key messages from the 40 indicators in the Lancet Countdown's 2017 report are summarised below.

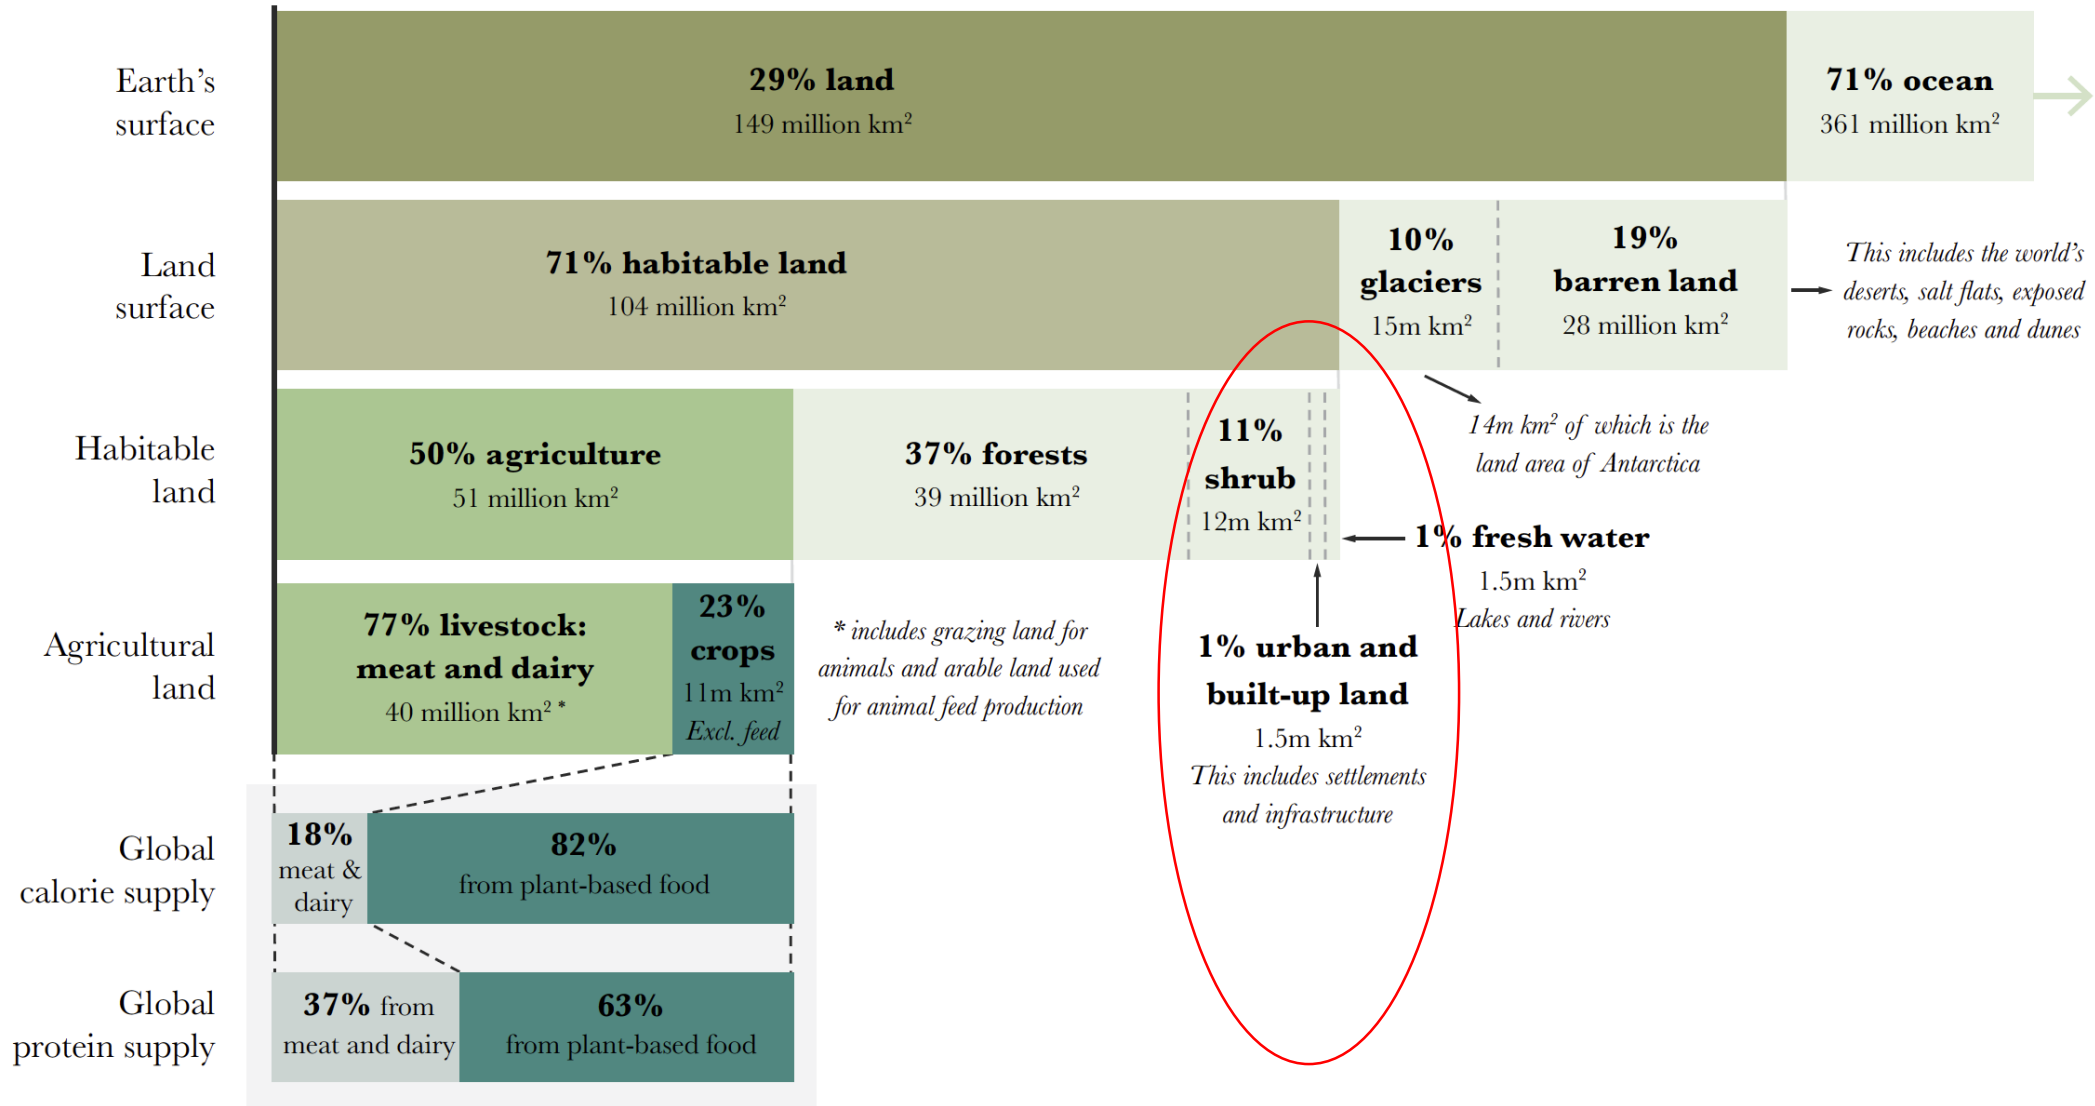

Air pollution kills 5.5 million and costs global economy \$225 billion each year

175 million people exposed to heatwaves in 2015. A record high, harming the health of millions.

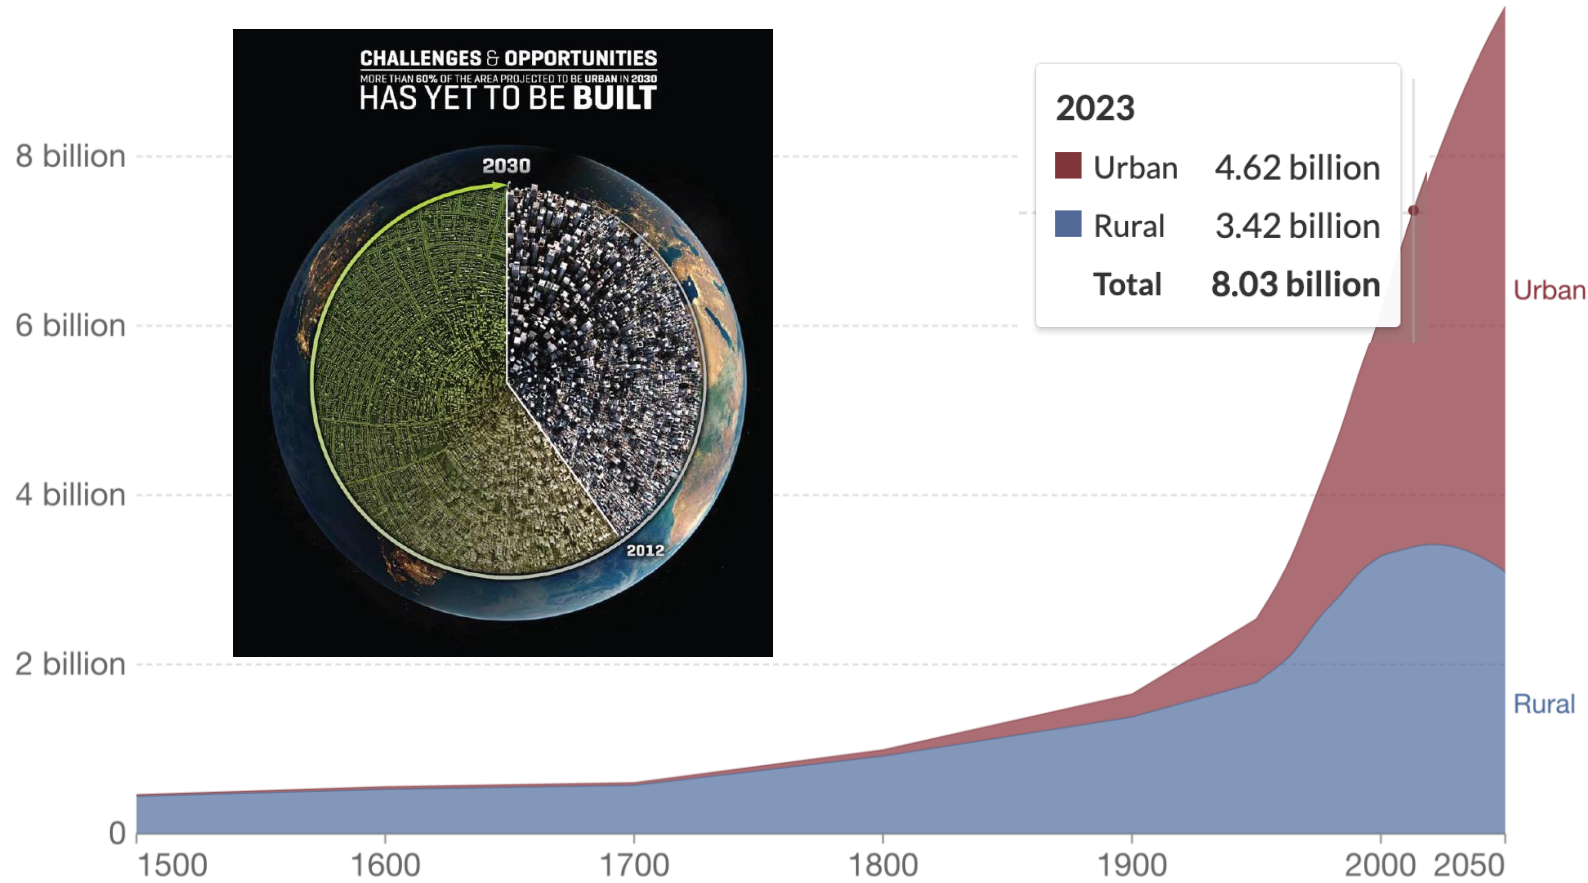

Global land use for food production

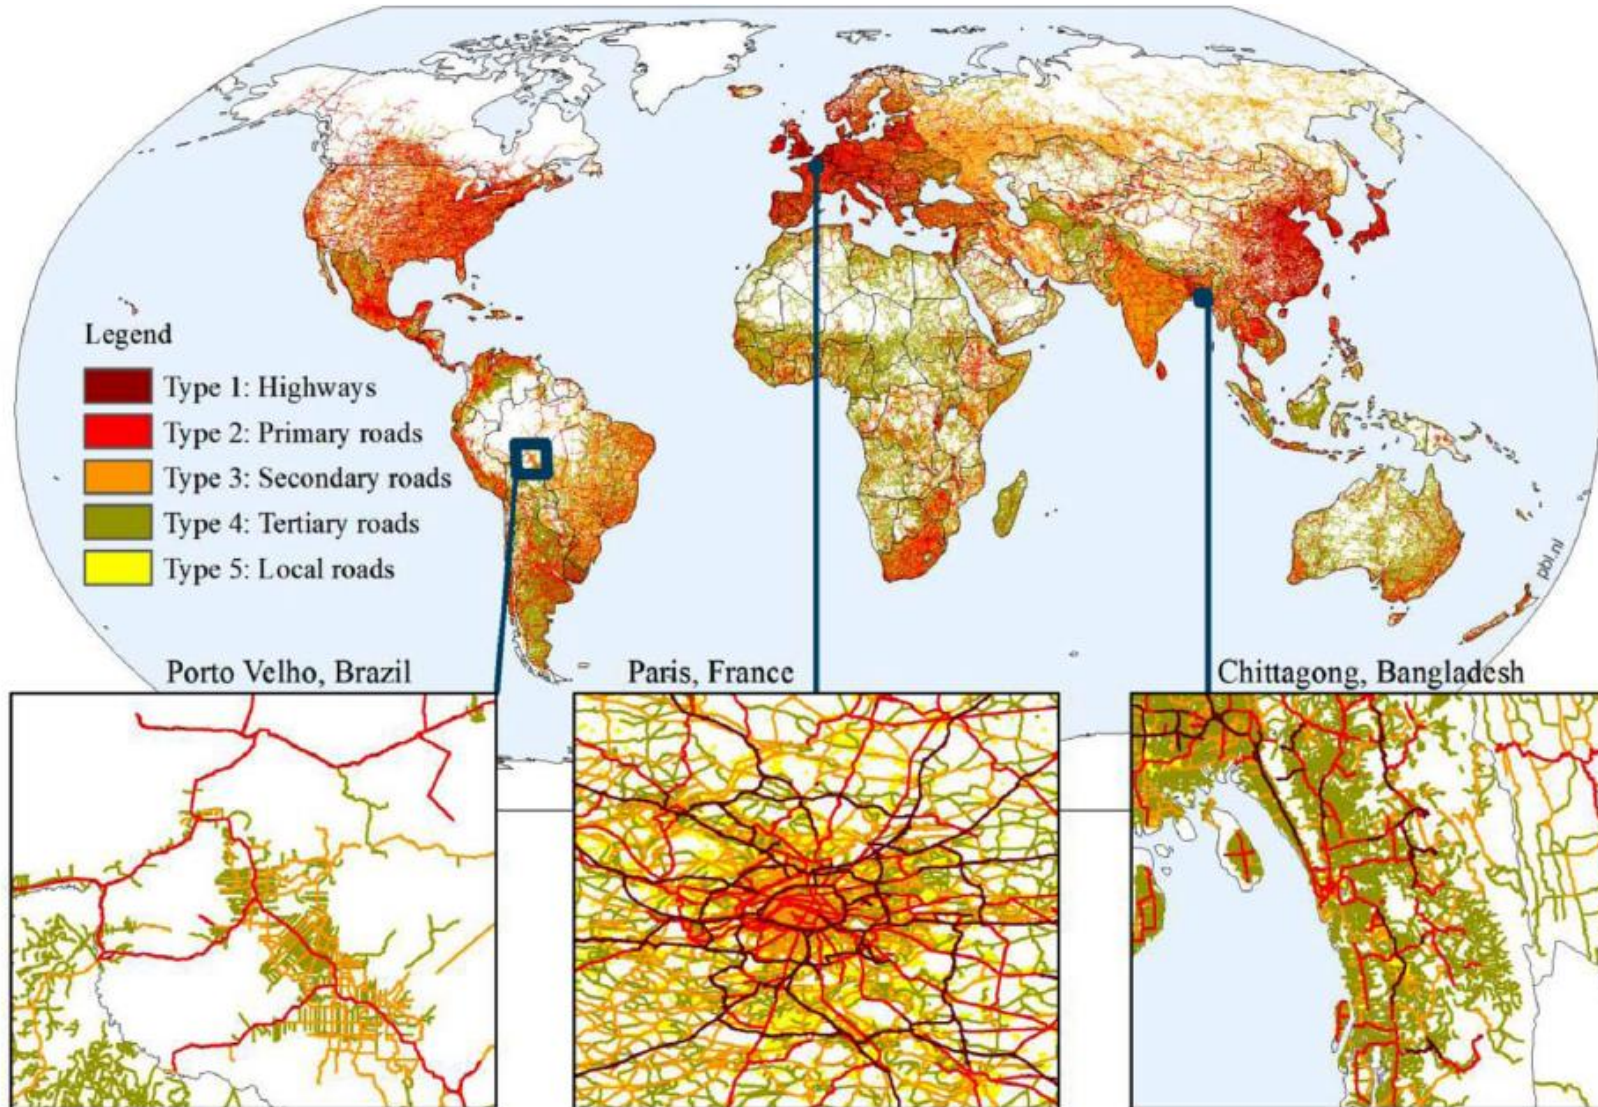

Urban and rural population projected to 2050, World, 1500 to 2050

Total urban and rural population, given as estimates to 2016, and UN projections to 2050. Projections are based on the UN World Urbanization Prospects and its median fertility scenario.

Our World
in Data

Highest road densities associated with more densely populated and wealthier countries

Most habitats are fragmented by roads

- 80% of globe remains roadless but roads act to fragment landscape into small patches (50% under 1km²)
- Urban areas have the smallest share of roadless areas.

80% of the world, 99% of US and European populations live under light polluted skies

Living Planet Index

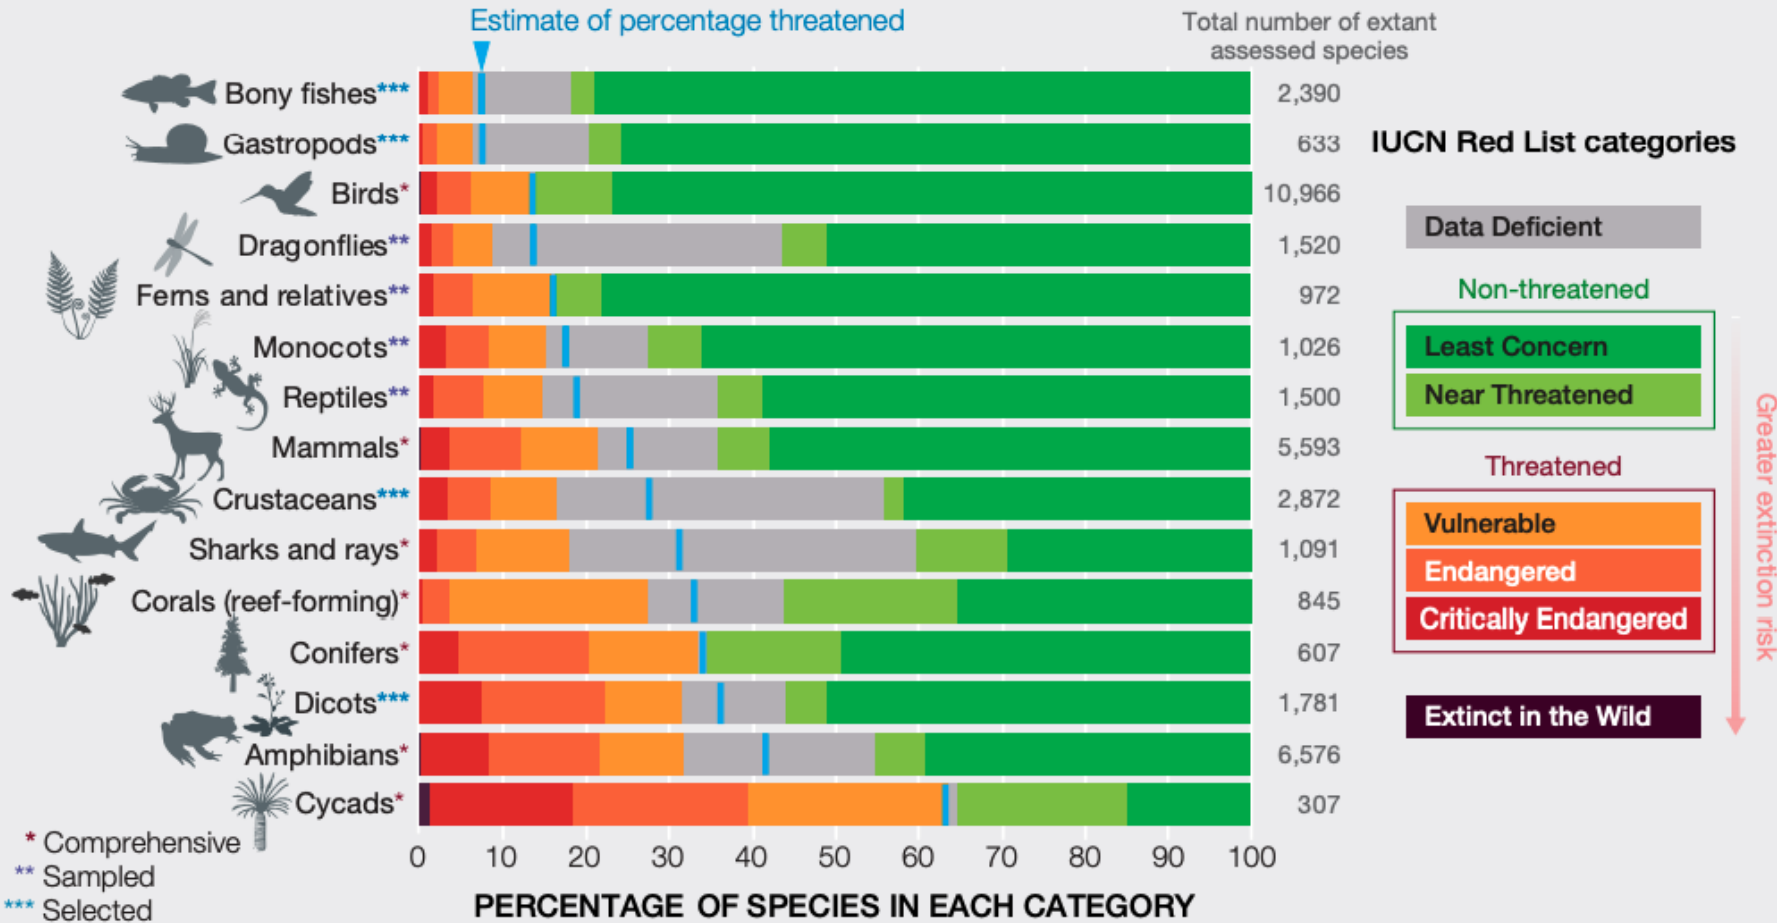

The Living Planet Index (LPI) now tracks the abundance of almost 21,000 populations of mammals, birds, fish, reptiles and amphibians around the world¹⁰⁷. Using the data from 20,811 populations of 4,392 species, the 2020 global LPI shows an average 68% decline in monitored populations

between 1970 and 2016 (range: -73% to -62%). The percentage change in the index doesn't represent the number of individual animals lost but reflects the average proportional change in animal population sizes tracked over 46 years.

Global risk of species extinction

A Current global extinction risk in different species groups

1 million species at risk of extinction

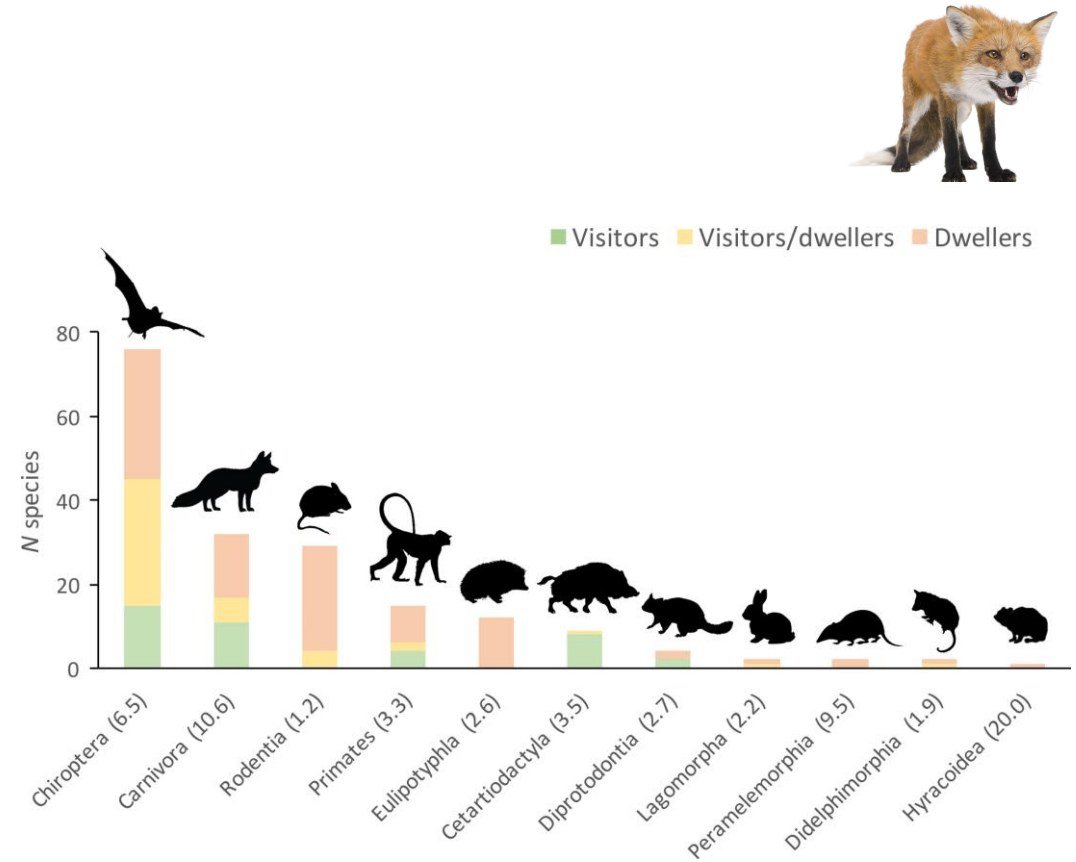

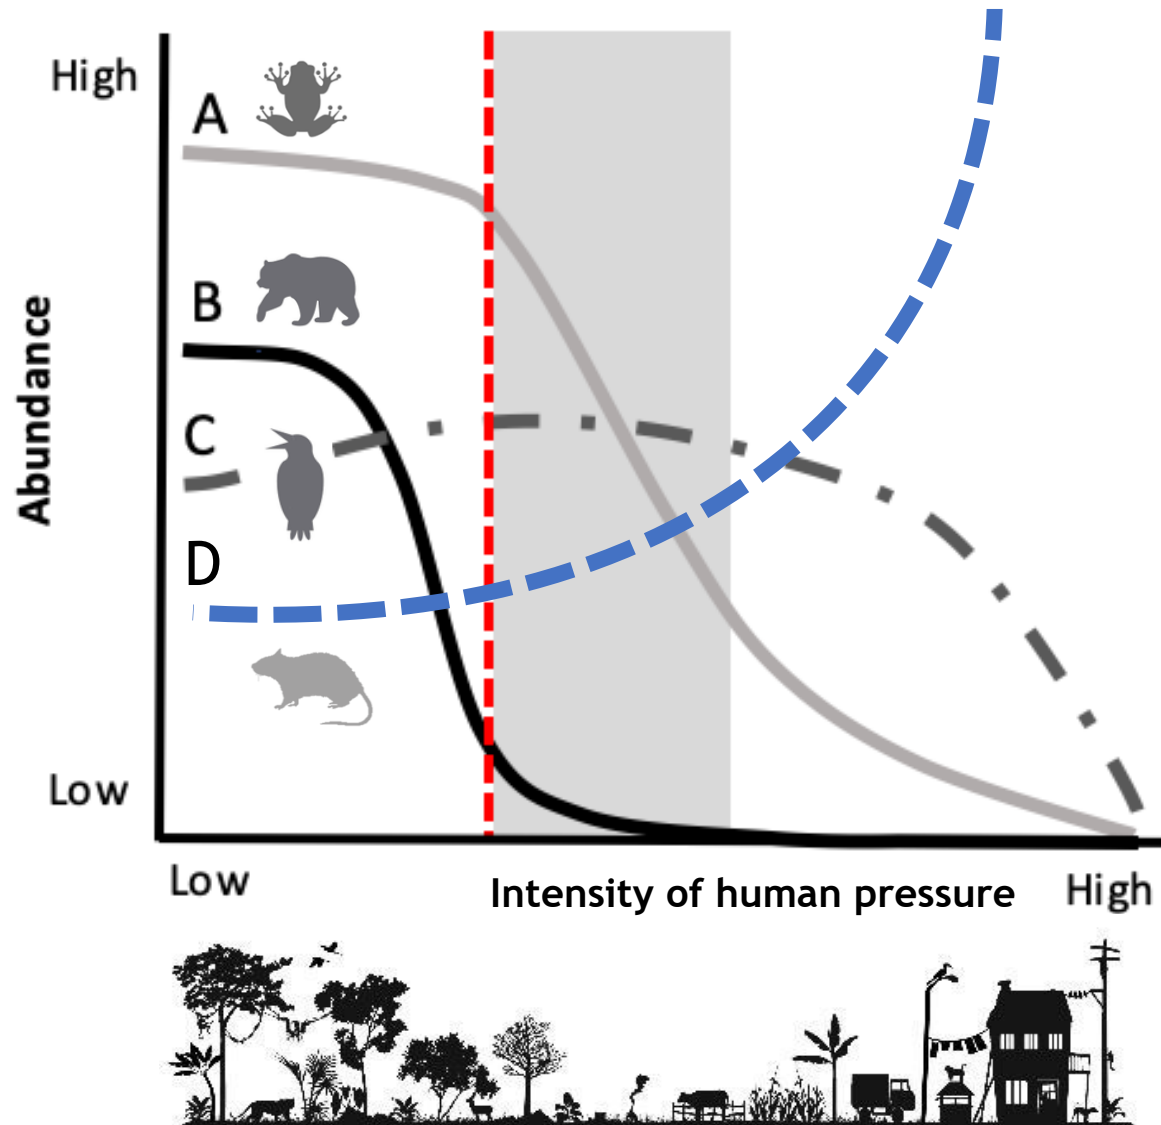

Cities are species poor

Increasing anthropogenic impact

Cities are strong filters for species

Santini *et al.* 2018 Ecology Letters

Adaptions to daily activity patterns

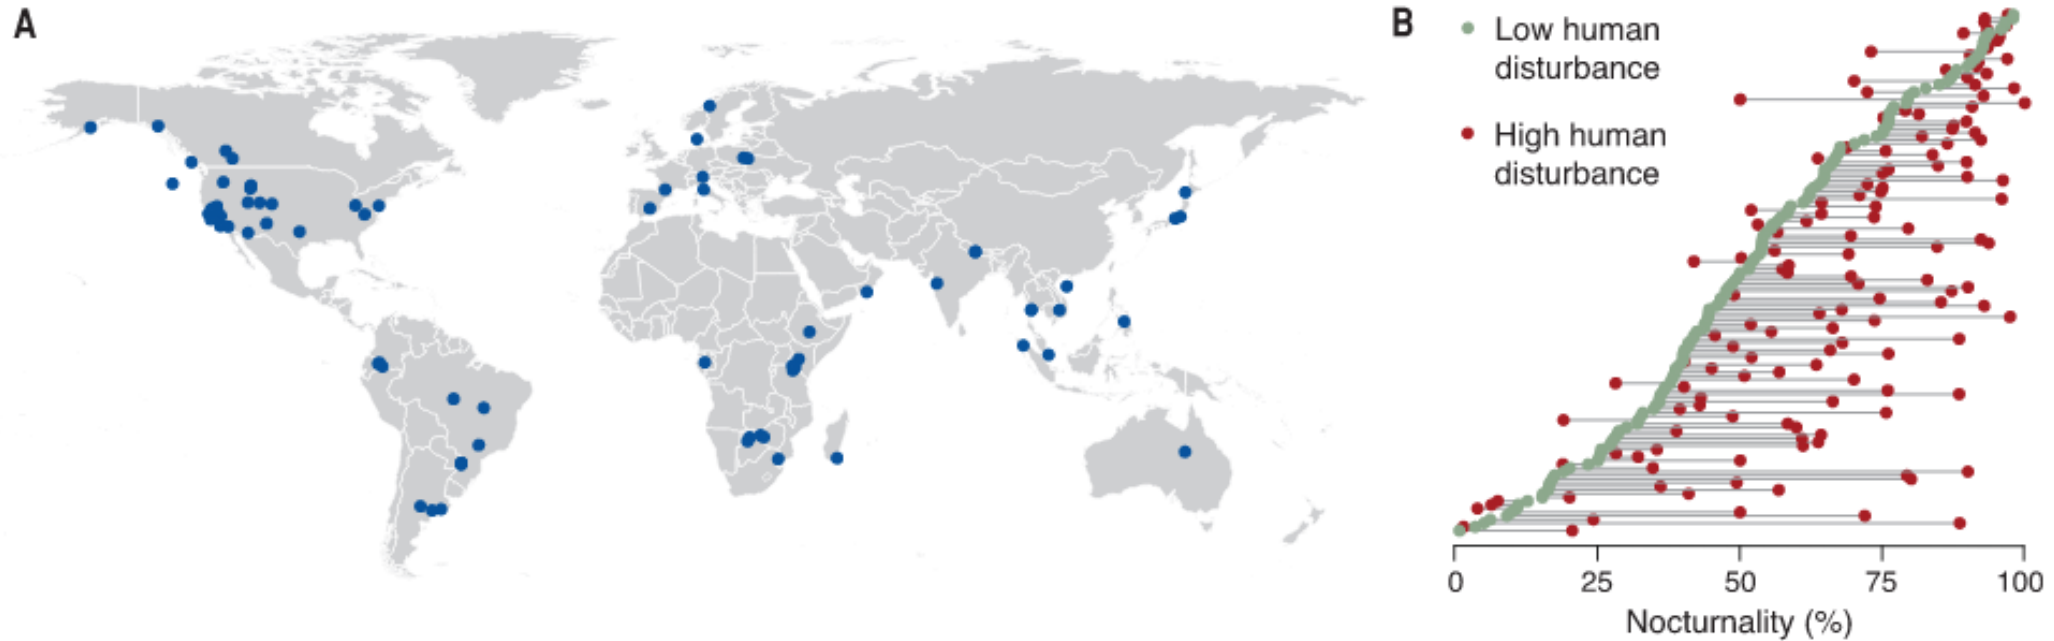

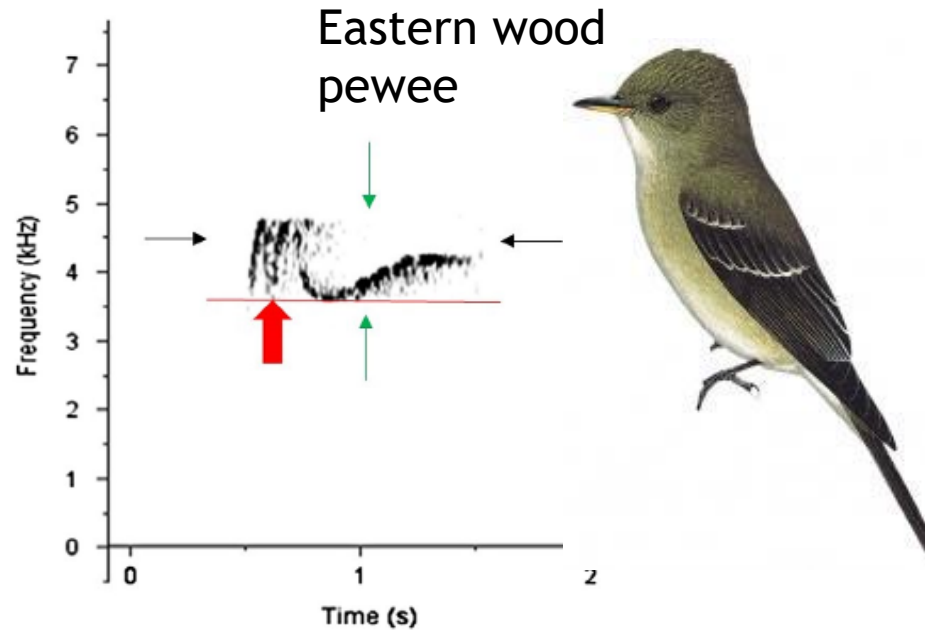

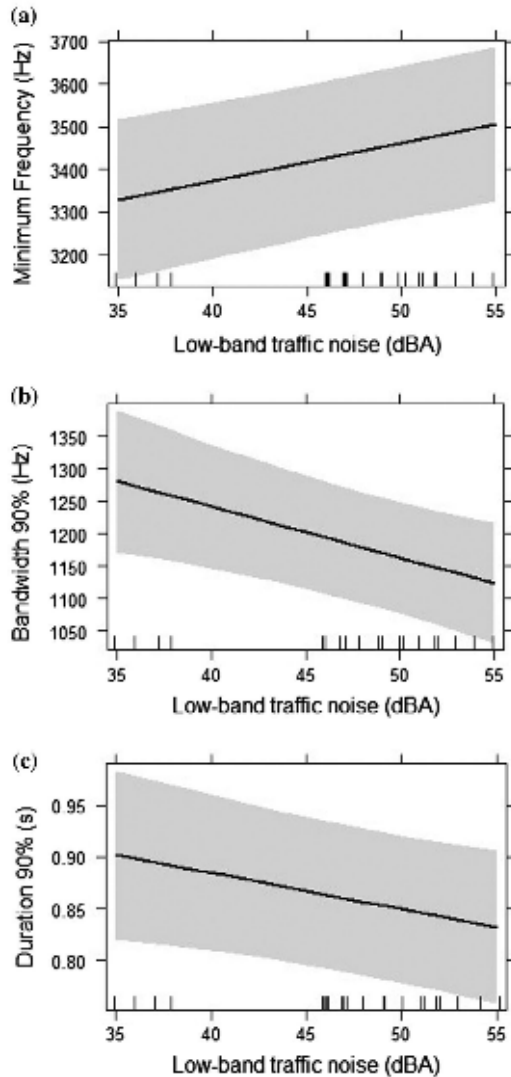

Fig. 1. Mammals become more nocturnal to avoid humans throughout the world. (A) Map illustrating the locations of the 76 studies included in the meta-analysis. (B) Paired measures of nocturnality (percentage of activity that occurs in the night) in areas of high human disturbance (X_H) and

low human disturbance (X_L), displayed for each species in each study ($n = 141$ effect sizes, ordered from high to low X_L). The relative change in nocturnality in response to human disturbance was used to calculate the effect size (RR) for the meta-analysis, where $RR = \ln(X_H/X_L)$.

Under increasing anthropogenic pressure - mammals become more nocturnal

Species adapt to cities - songs

Adaptions to communicating in noisier environments

After road closures, bird populations decreased min frequency, increased bandwidth and increased duration of their call

Mayibout 2 is not a healthy place. The 150 or so people who live in the village, which sits on the south bank of the Ivindo River, deep in the great Minkebe Forest in northern **Gabon**, are used to occasional bouts of diseases such as malaria, dengue, yellow fever and sleeping sickness. Mostly they shrug them off.

Species that make us sick thrive in degraded land

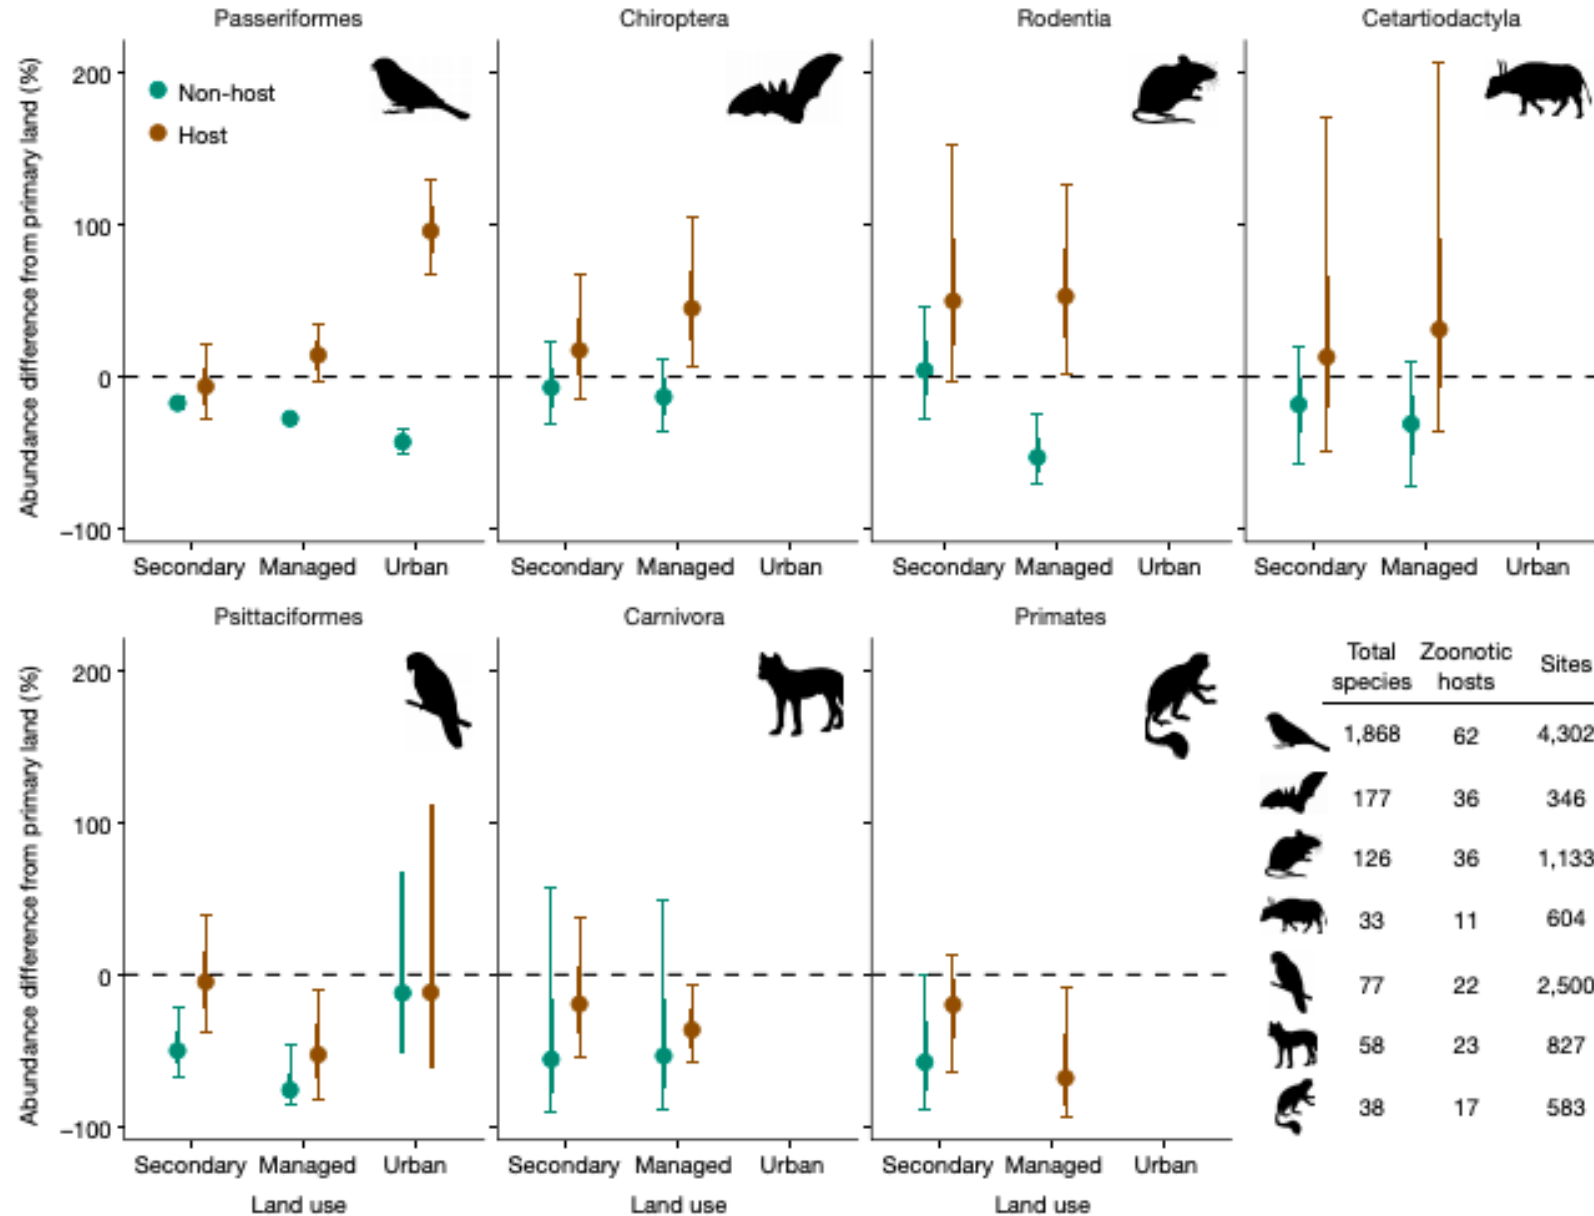

Zoonotic hosts are higher proportion of species richness and total abundance in intensely-used, human-managed and urban ecosystems than in nearby undisturbed habitats

6801 ecological assemblages, 376 host species

Taxa respond differently to anthropogenic drivers

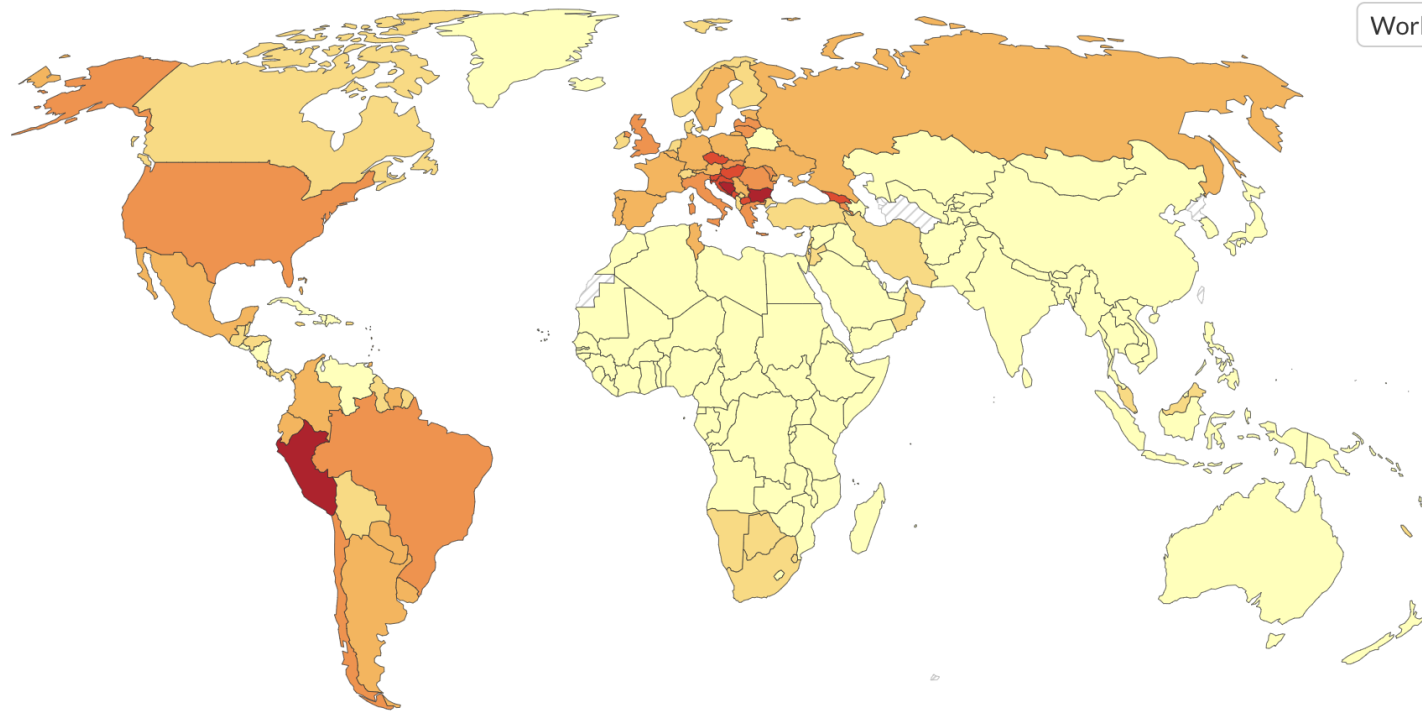

How bats changed the world

Cumulative confirmed COVID-19 deaths per million people, May 3, 2023

Due to varying protocols and challenges in the attribution of the cause of death, the number of confirmed deaths may not accurately represent the true number of deaths caused by COVID-19.

Our World in Data

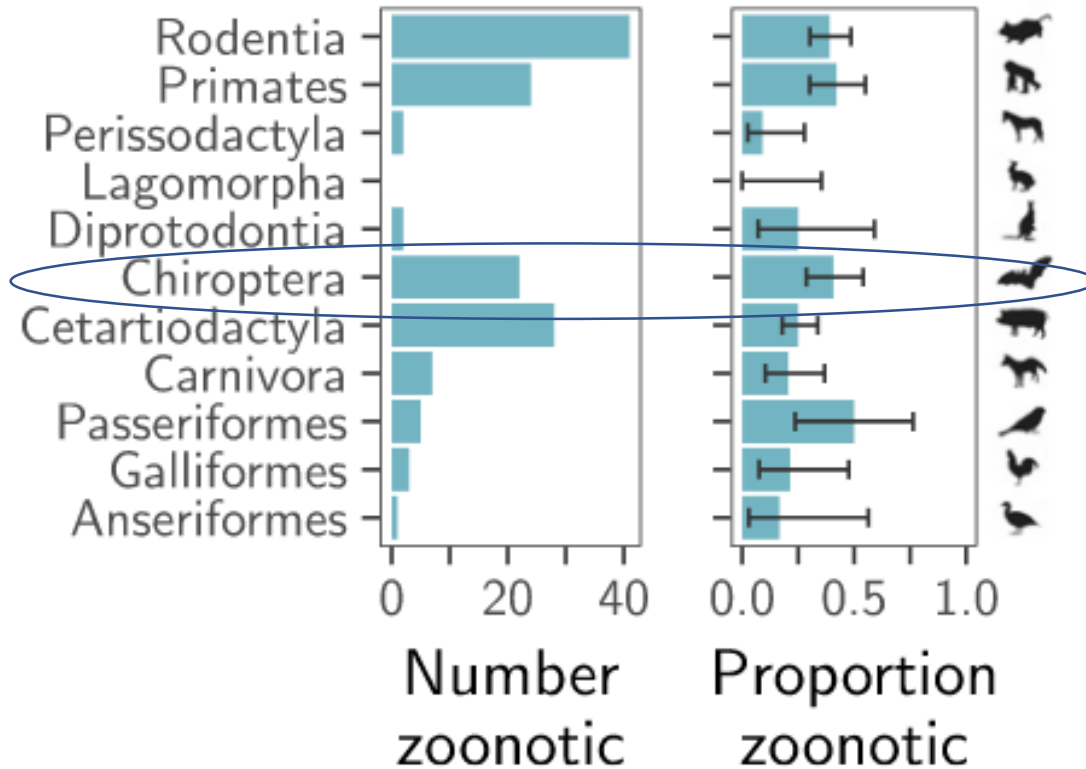

World

Andersen *et al.* 2020 *Nature Medicine*

Are bats special hosts of viruses?no

Bats have a lot of zoonotic viruses but there are a lot of bat species - bats don't have proportionally more viruses

Are bats special hosts of viruses? ...maybe

Impact of flight on evolution

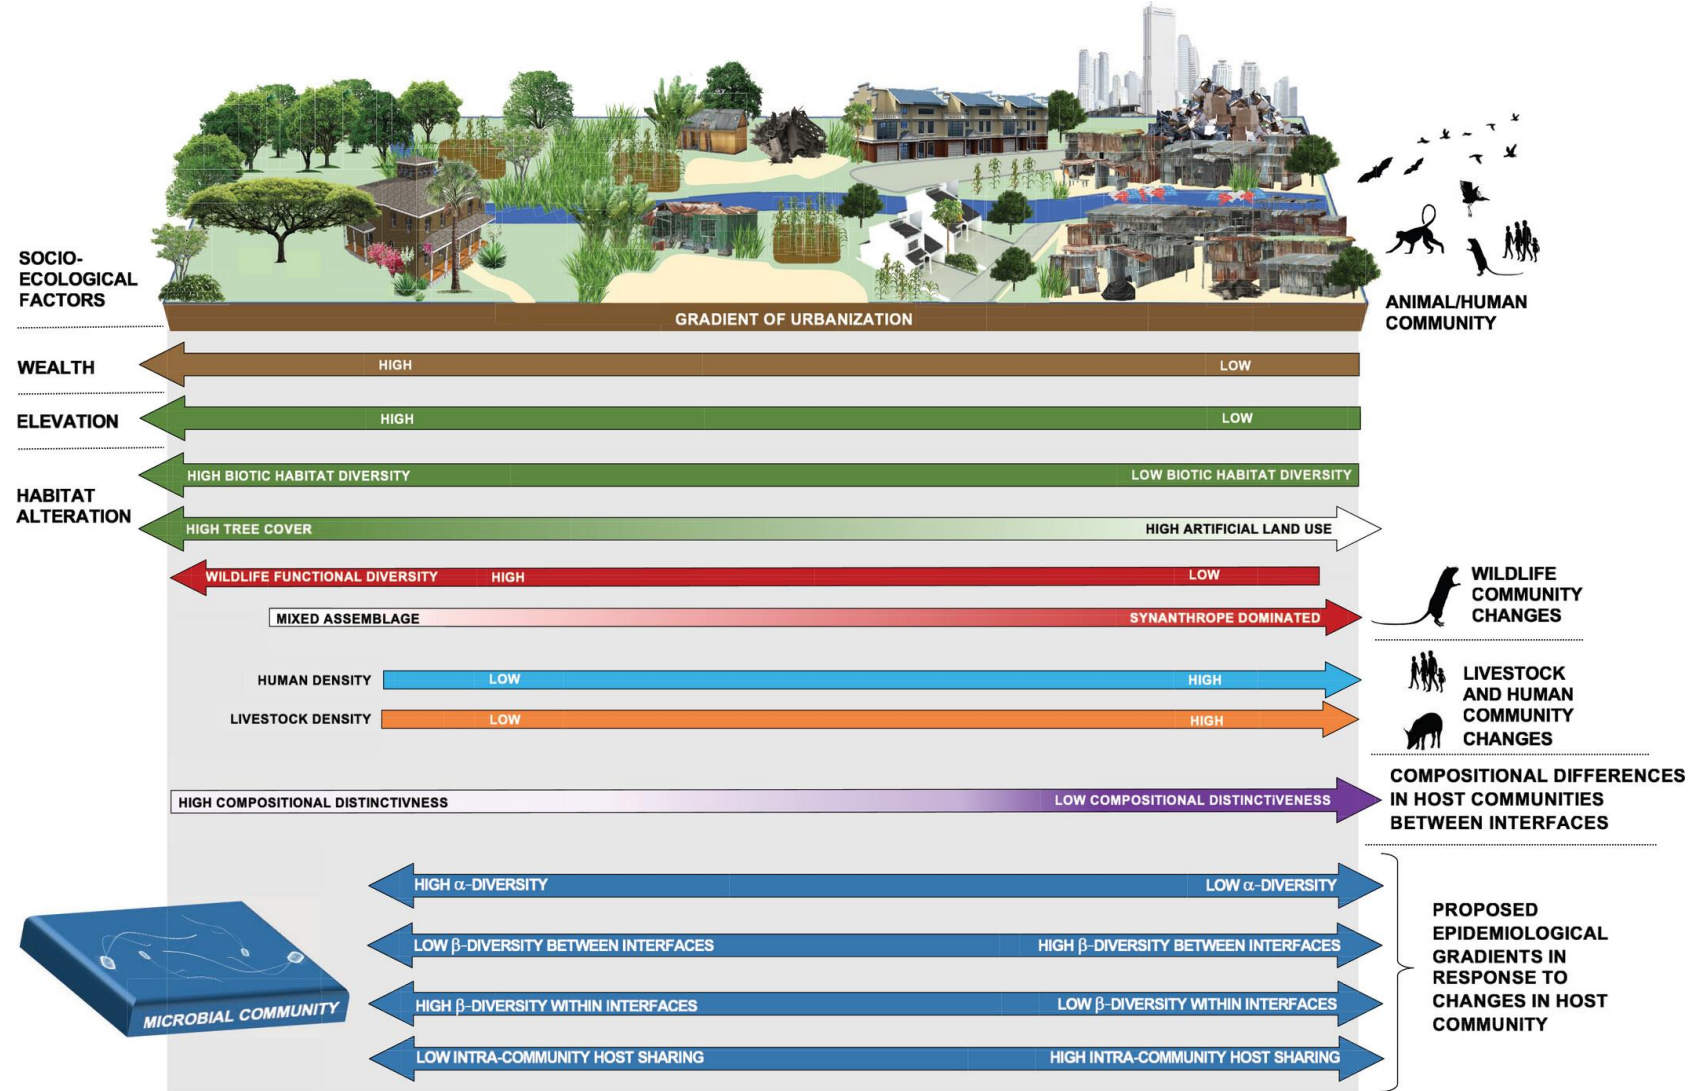

Bats may have adaptations to flight that make them better able to host viruses without showing symptoms and viruses that humans aren't adapted to

Subudhi *et al* 2019 *Viruses*

"Tip of the iceberg": Is our destruction of nature responsible for Covid-19?
A study published in *Nature* suggests that the destruction of nature is responsible for the emergence of new zoonotic diseases.
More than 1 million species are at risk of extinction, and the loss of biodiversity is accelerating. This is not just a crisis for nature, but also for human health. The World Health Organization (WHO) has warned that the loss of nature is a major threat to global health. The study, led by researchers from the University of Cambridge, found that the loss of nature is increasing the risk of zoonotic diseases, which are diseases that can be transmitted from animals to humans. The researchers argue that the destruction of nature is creating a 'tip of the iceberg' of zoonotic diseases, with many more hidden beneath the surface. They call for urgent action to protect nature and prevent the emergence of new zoonotic diseases.

"Tip of the iceberg": Is our destruction of nature responsible for Covid-19?

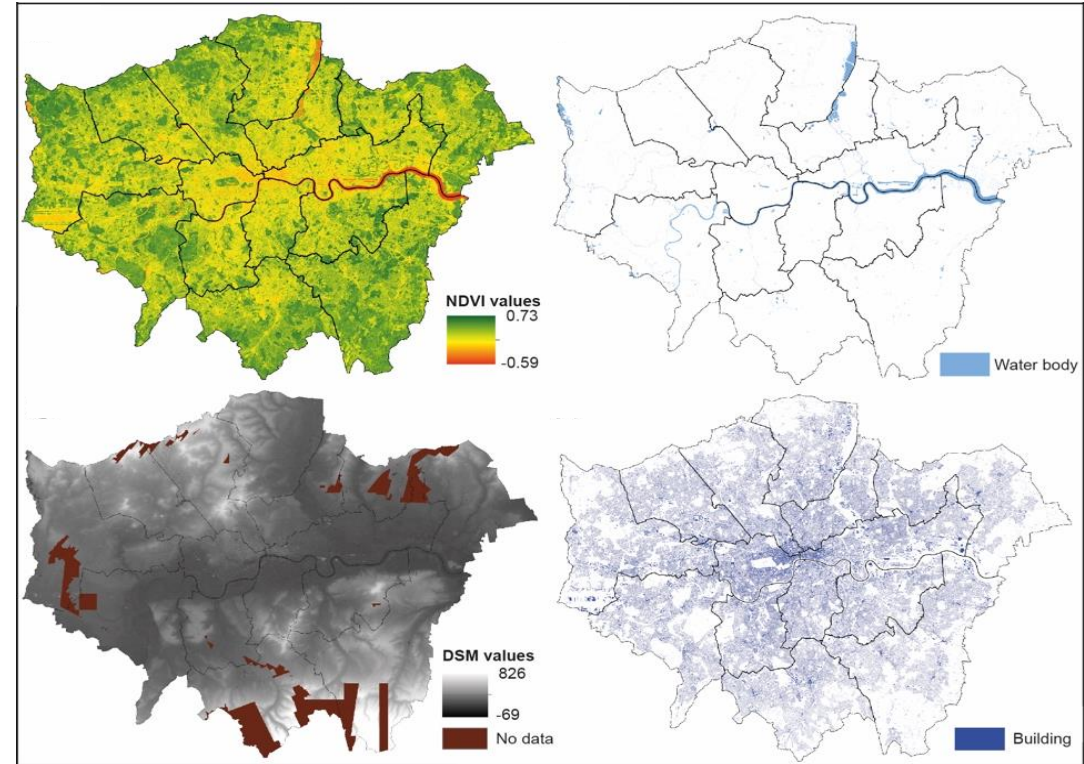

Abstract and full text available from <https://doi.org/10.1016/j.glo.2020.05.001>

More than 1.7 million people have died from the coronavirus disease (Covid-19) since it was first reported in Wuhan, China in December 2019. The World Health Organization (WHO) has declared the outbreak a global health emergency. The disease is caused by a novel coronavirus, which is thought to have originated in an animal, possibly a bat, and spread to humans. The WHO has advised that people should avoid contact with wild animals and live animals in markets, and avoid eating wild animals. The WHO has also advised that people should avoid contact with people who have been in contact with wild animals in markets.

Woodland helps children's cognitive function

High levels of surrounding green space associated with higher cognitive function in children (Imperial SCAMP study 6000 children, 41 schools)

Tip of the iceberg: is our destruction of nature responsible for Covid-19?
 A study led by researchers from Imperial College London and the University of Exeter has found that the loss of natural space is a significant risk factor for the spread of the virus.

City green space is a highly valuable asset

London's greenspace has gross asset value of £91 billion, providing annual services of £5 billion

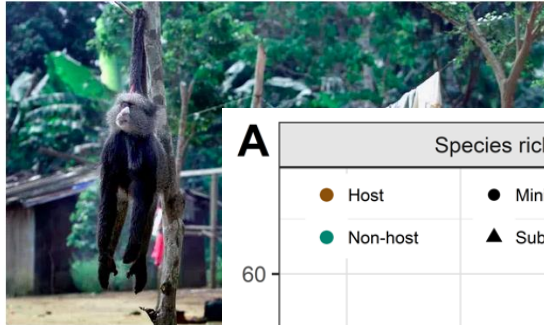

For the average household in London, the monetary value of being in close proximity to a park or green space is over £900 per year

Benefits not spread equally across London

Growing evidence base

Direct Observational Monitoring

Direct observations allow for studying fish and wildlife in their natural environment. A limitation of these direct observations is that they are limited to daylight observations, common species, and areas where these species can readily be observed.

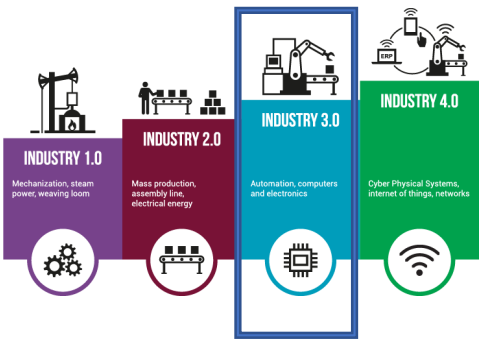

Radio collars and camera traps permit wildlife tracking and sighting without direct observations. Using these data along with mark-resight models allows for better estimates of population estimates.

eDNA collected from water, snow, soil, air, and scats can be used to detect and monitor species. eDNA can provide additional information on species such as individual identification, which allows for population estimates.

Researchers can deploy autonomous recording units (ARUs) for passive acoustic monitoring of vocalizing species like birds, marine mammals, amphibians, and insects. Automated classifiers analyze these data to detect and identify species, providing valuable information about their ecology.

Remote sensing heightens the accuracy of landscape variable measurements. Satellite tracking devices have been miniaturized, allowing for real-time tracking of numerous species. Devices can now measure heart rate, body temperature, and daylight patterns, and can even include video cameras.

iNaturalist - collecting millions of observations

How It Works

Record your observations Share with fellow naturalists Discuss your findings

Nature At Your Fingertips

- Keep Track**
Record your encounters with other organisms and maintain life lists, all in the cloud.
- Create Useful Data**
Help scientists and resource managers understand when and where organisms occur.
- Crowdsource Identifications**
Connect with experts who can identify the organisms you observe.
- Become a Citizen Scientist**
Find a project with a mission that interests you, or start your own.
- Learn About Nature**
Build your knowledge by talking with other naturalists and helping others.
- Run a Bioblitz**
Hold an event where people try to find as many species as possible.
